

At Spraylat, sustainability is not just a goal, it is part of how we do business.

Closed loop recycling allows us to take responsibility for the full life cycle of our products, ensuring materials are reused rather than wasted. This approach reduces environmental impact, conserves resources, and supports our customers in meeting their own sustainability targets.

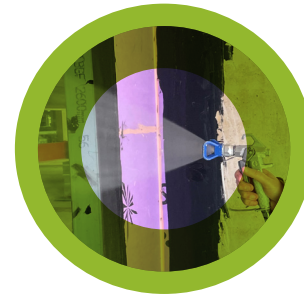

By investing in closed loop solutions, we are helping to create a cleaner, more efficient future for our industry.

It is a commitment to innovation, responsibility, and partnership that benefits both our clients and the planet.

5. DISPATCH

1. CONDENSE

Once removed, Protectapeel condenses into a compact ball that is easy to handle and store. The used coating is placed into our dedicated recycling bags, reducing both skip space and landfill contributions compared to traditional protection methods.

2. COLLECT

When your site is ready, simply call our team to arrange a free collection. The material is returned to our Corby facility, where it enters our closed-loop recycling system. Each batch is washed to remove dust and debris, ensuring a clean stream for processing.

The coating is then shredded into small pieces before being melted down into a reusable liquid form. By recycling Protectapeel in this way, we cut waste to landfill, lower environmental impact, and help contractors improve their sustainability credentials.

This controlled process maintains product quality while creating a circular system in which the same material is used again in production. Customers who return Protectapeel support a greener supply chain and demonstrate compliance with modern ESG goals.

Once reprocessed, Protectapeel is manufactured into new coatings and distributed worldwide. Our protective coatings not only protect valuable surfaces but also contribute to a more sustainable future.
